

CHANDLER LIMITED®

GERMANIUM DRIVE

The Germanium Drive is really a germanium pedal like none you've used before. It has all the tone and color you would expect from germanium but none of the mud and none of the fat – only an intense colored germanium tone. This pedal was inspired by our Germanium preamps and our work with other germanium amplifiers, but has even more to it. The five feedback selections on the Germanium Drive modify the tone, harmonic distortion and clipping of the pedal and offer a nice range of uses from tighter, lightly driven to slightly fuzzy to full on germanium hell!

POWER

The Germanium Drive pedal runs on any two separate 9-volt "BOSS" style power supplies. Only use power supplies with the \oplus — \ominus polarity symbol. Refer to Manual for proper connection.

OUTPUT JACK

Connects to amplifier or other source such as computer input.

INPUT JACK

Connects to guitar, bass or keyboard.

GERMANIUM DRIVE

This is the amount of gain you can select from the pedal.

FEEDBACK

Selects the negative feedback of the unit. Negative feedback will change the gain, frequency response clipping, and harmonic distortion of pedal.

HIGHS

Sets the overall brightness of the pedal.

BOOST RANGE

Selects the frequency response of the pedal.

BYPASS

True bypass, full bypass, or hardwire bypass. Whichever term you like!
